Because the 3D model is the central source of design data, it becomes accessible by all team members and the flow of information is released as soon as the design cycle begins. In essence, Model-Based Design opens a larger pipeline, allowing the team to receive, understand, and evaluate designs faster than the traditional step-by-step approach.

Current users find that Model-Based Design (MBD) breeds a parallel collaborative design environment, modernizing the development life

Model-Based Definition (MBD) is a mechanical engineering initiative where a 3D model with Product Manufacturing Information (PMI) augments or replaces a 2D engineering drawing as design documentation. Product and Manufacturing Information (PMI) is composed of non-geometric information that describes a design, including Geometric Dimensioning and Tolerancing (GD&T), surface finish, material information and more.

Model-Based Definition (MBD) | Lifecycle Insights

In a 3D model it is easier to see the impact on the overall design when minor or major changes are made, this would help in finalizing the design without much cost and post-construction cost-incurring changes or corrections. It is also accurate as the end construction shapes-up to the conceived output as deduced from the 3D model.

3D modeling has also benefited those in the field of architectural design. Instead of relying on paper and pencil sketches and outlines, designers can now take their dimensions for a floor plan and translate it into a digitally rendered, 'real' environment (we have nothing against paper and pencil—may they continue to serve us well!). Like a video game's environment, the 3D modeler has ...

omitted. To tackle these problems, this study proposes a 3D printable multi-layer design that models the hand with the layers of skin, tissues, and bones. The proposed design first obtains the 3D surface model of a target hand via 3D scanning, and then generates the 3D bone models from the surface model based on a fast template matching method.
