As an application we obtain a characterization of acyclic maps of topological spaces in terms of induced maps of their chain algebras of based loop spaces. In the case of a universal acyclic map we obtain, for a wide class of spaces, an explicit algebraic description for these induced maps in terms of derived localization. AB - We show that the notions of homotopy epimorphism and homological epimorphism in the category of differential graded algebras are equivalent.

We obtain the complete topological characterization of the system in terms of the invariants and ν_j , where ν_j is the winding of protocol U_j . Figure 6 (a) shows C_0 and $C_?$ on the line. To illustrate the 'bulk-boundary' correspondence for this model, in figure 6 (b) we show the energy spectrum and the degree of localization of eigenstates in a ...

In mathematics, a topological space is usually defined in terms of open sets. However, there are many equivalent characterizations of the category of topological spaces. Each of these definitions provides a new way of thinking about topological concepts, and many of these have led to further lines of inquiry and generalisation.

of topological vector spaces, for every $i \in \mathbb{Z}$. Here $\text{ind}_G H$ denotes the Schwartz induction as defined by du Cloux, see [7, Section 2]. χ_G denotes the modular character of the group G and $\chi_{G/H} := (\chi_G)|_H \cdot \chi_H^{-1}$. It should be pointed out that the Schwartz homology $H_S^i(G; V)$ as a topological vector space, is not necessary Hausdorff.

Topological spaces can be characterized by using topological invariants. In this work, we use simplicial complexes as topological spaces and persistent homology to determine their invariants [5].

Exploiting topological features in materials is being pursued as a route to build in robustness of particular properties. Stemming from crystalline symmetries, such topological protection renders the properties robust against defects and provides a platform of rich physics to be studied. Recent developments have revealed the existence of so-called fragile topological phases, where the means of ...

Optical vortices are associated with a spatial phase singularity. Such a beam with a vortex is valuable in optical microscopy, hyper-entanglement, and optical levitation. In these applications, vortex beams with a perfect circle shape and a large topological charge are highly desirable. But the generation of perfect vortices with high topological charges is challenging.
