A discrete event system is a system in which the state of the system changes only at discrete points in time. There are essentially two fundamental viewpoints for modeling a discrete event system within simulation: the event view and the process view. These views are simply

An Introduction to Discrete-Event Simulation

A discrete-event simulation models the operation of a system as a sequence of events in time. Each event occurs at a particular instant in time and marks a change of state in the system. Between consecutive events, no change in the system is assumed to occur; thus the simulation time can directly jump to the occurrence time of the next event, which is called next-event time progression. In addition to next-event time progression, there is also an alternative approach, called fixed-increment time

Definition 5.2. A discrete probability space (or discrete sample space) is a triple (W, F, Pr) consisting of: 1. A nonempty countably infinite set W of outcomes or elementary events. 2. The set F of all subsets of W , called the set of events. 3. A function $Pr: F \rightarrow [0, 1]$, called probability measure (or probability distribution) satisfying the following properties: a.

Mathematically – $P(B | A) = P(A \cap B) / P(A)$ If event A and B are mutually exclusive, then the conditional probability of event B after the event A will be the probability of event B that is $P(B)$.

A probability distribution is a mathematical description of the probabilities of events, subsets of the sample space. The sample space, often denoted by Ω , is the set of all possible outcomes of a random phenomenon being observed; it may be any set: a set of real numbers, a set of vectors, a set of arbitrary non-numerical values, etc. For example, the sample space of a coin flip would be $\Omega = \{\text{heads}, \text{tails}\}$.

Control of Discrete-Event Systems | SpringerLink

In discrete systems, the changes in the system state are discontinuous and each change in the state of the system is called an event. The model used in a discrete system simulation has a set of numbers to represent the state of the system, called as a state descriptor.
