The ideal gas law,  $PV = nRT$  is applicable only ideal gases. It is a good approximation of real gases under low pressure and/or high temperature. At high pressure and low temperature, the ideal law equation deviates significantly from the behaviour of real gases.

This law states that: the volume of a given amount of gas is directly proportional to the number on moles of gas, directly proportional to the temperature and inversely proportional to the pressure. i.e.  $pV = nRT$ .

For example, the ideal gas law makes an assumption that gas particles have no volume and are not attracted to each other. Here's why the ideal gas law has limitations. Imagine that you condense an ideal gas. Since the particles of an ideal gas have no volume, a gas should be able to be condensed to a volume of zero.
