In 1969, Chen went from Princeton to UCLA in California, where he organized an academic program in plasma physics. He wrote the first undergraduate textbook in this field in 1973. Soon after, however, powerful lasers were invented, opening up a whole new field of research.

Introduction to Plasma Physics and Controlled Fusion ...

The third edition of this classic text presents a complete introduction to plasma physics and controlled fusion, written by one of the pioneering scientists in this expanding field. It offers both a simple and intuitive discussion of the basic concepts of the subject matter and an insight into the challenging problems of current research.

Introduction to Plasma Physics and Controlled Fusion ...

These notes are intended to provide a brief primer in plasma physics, introducing common definitions, basic properties, and typical processes found in plasmas.

6 CHAPTER 1. INTRODUCTION According to the definition of the Debye Length $D = (\frac{0kT}{e n e^2})^{1/2} = 2.3 \times 10^8 \log(D) = 1.2 \log(0.02) + 1.2 \log(kT/e) + 2 \log(n) = \log(n) + 2 \log(D/7430) = \log(n) + 2 \log(D/7430) = \log(n) + 2 \log(D/7430) = \log(n) + 2 \log(D/7430)$ (kT in eV)(1.3) Then we can draw the solid straight line in the Figure?? with the Debye length as parameter ranged from 10¹ to 10⁷. Points on a certain solid line,

plasma's temperature and density. An ideal plasma has many particles per Debye sphere, i.e. $N_D n_e \gg 1$; (8) which is a prerequisite for the collective behaviour discussed earlier. An alternative way of expressing this condition is via the so-called plasma parameter, $n_e \gg 10^3 D^3$; (9) which is essentially the reciprocal of N_D . Classical plasma theory is based on the assumption that $n_e \gg 1$,

As I've told several of them, Chen's book essentially "leads you by the hand" - going through particle motions, gyro-frequencies, adiabatic invariants etc., to magnetic mirror systems (including loss cone angles and Fermi accelerations applied to them) to plasma instabilities and MHD, whereas many others (even 'Plasma Physics' by Krall and Trivelpiece) tend to assume too much.

By developing helicon plasma sources, which are magnetized, Chen showed that radiofrequency gas discharges contain very interesting physics which can be treated in a logical and interesting manner. Chen's 57-year career in plasma physics can be divided into four approximately equal parts: magnetic fusion, laser fusion and laser accelerators, low-temperature plasma physics, and plasma ...
