Lab 6 - Echinoderms and Chordates Introduction to Echinoderms. Our closest cousin among the invertebrates is a most unlikely taxon, the echinoderms (Phylum Echinodermata, = spiny skin; 6,000 sp) Echinoderms are eucoelomate deuterostomes. They show a superficial five part (pentamerous) radial symmetry. The larvae are bilaterally symmetric, cephalized, and motile, but they develop into sessile or sedentary radially symmetric adults.

Body Dissection. Place the frog belly side up in the dissecting tray. You can pin down the limbs if necessary. Lift up the skin with forceps midway between the hind legs of the frog. Use scissors to cut the skin along the midline of the frog starting between the hind legs and ending at the neck. Be careful not too cut too deeply.
