Acoustics is a first order approximation in which non-linear effects are neglected. In classical acoustics the generation of sound is considered to be a boundary condition problem. The sound generated by a loudspeaker or any unsteady movement of a solid boundary are examples of the sound generation mechanism in classical acoustics.

Acoustical engineers use decibels to quantify sound loudness, but when it comes to acoustics design in buildings, that measure is just one way of evaluating its performance. There are two primary metrics used in noise measurement for evaluating the acoustic performance in a building's acoustical performance: acoustical absorption and sound transmission loss.
