Lid-driven cavity. Note: CFD-calculations have been deactivated in version 2.7 due to unsatisfactory results. A new approach is being pursued. The lid-driven cavity is a well-known benchmark problem for viscous incompressible fluid flow . The geometry at stake is shown in Figure 27. We are dealing with a square cavity consisting of three rigid walls with no-slip conditions and a lid moving with a tangential unit velocity.

The lid-driven cavity (LDC) is a common test or bench-mark problem in computational fluid dynamics (CFD) particularly as one that critically tests the accuracy of the advection (convective acceleration) scheme used for the computations. The figure that follows is an example calculation that illustrates the essential features of the computation which consists of a rectangular cavity, a square one in this case, where the (Newtonian) fluid inside is set in motion by dragging the upper edge of ...
