Molecular recognition between peptides and metal oxide surfaces is a fundamental process in biomineralization, self-assembly, and biocompatibility. Yet, the underlying driving forces and dominant mechanisms remain unclear, bringing obstacles to understand and control this process. To elucidate the mechanism of peptide/surface recognition, specifically the role of serine phosphorylation, we employed molecular dynamics simulation and metadynamics-enhanced sampling to study five artificial ...

The driving forces for phase separation, quantified in terms of measured saturation concentrations, follow the order: tyrosine-arginine > tyrosine-lysine ≈ phenylalanine-arginine > phenylalanine-lysine (Figures 4A and 4B). This shows that the selective preference for tyrosine-arginine interactions cannot be solely due to generic cation-π interactions.

Molecular Driving Forces; Statistical Thermodynamics In Chemistry And Biology - PDF Free Download. The Evans—Polanyi model is a linear energy relationship that serves as an efficient way to calculate activation energy of many reactions within a distinct family. The activation energy may be used to characterize the kinetic rate parameter of a given reaction through application of the Arrhenius equation.

Biological phase separation is known to be important for cellular organization, which has recently been extended to a new class of biomolecules that form liquid-like droplets coexisting with the surrounding cellular or extracellular environment. These droplets are termed membraneless organelles, as they lack a dividing lipid membrane, and are formed through liquid-liquid phase separation (LLPS ...
