The central goal of nonequilibrium many-body theory is to calculate real-time correlation functions. For example, we might want to calculate the 1-particle time-ordered Green's function, $iG(x,t;x_0,t_0) = \langle T[\psi(x,t)\psi^\dagger(x_0,t_0)] \rangle$ (1.1) in the Heisenberg picture, where ψ is an arbitrary nonequilibrium density

A large number can be anywhere from three to infinity (in the case of a practically infinite, homogeneous or periodic system, such as a crystal), although three- and four-body systems can be treated by specific means (respectively the Faddeev and Faddeev-Yakubovsky equations) and are thus sometimes separately classified as few-body
