Smoke Testing. Smoke Testing is a software testing process that determines whether the deployed software build is stable or not. Smoke testing is a confirmation for QA team to proceed with further software testing. It consists of a minimal set of tests run on each build to test software functionalities.

the facility • Smoke testing should demonstrate unidirectional air flow over critical equipment surfaces • If areas of air disturbance are observed, may require movement of equipment or adjustment

*Facilities and Equipment: CGMP Requirements*

Smoke Testing. Smoke Testing is a software testing technique performed post software build to verify that the critical functionalities of software are working fine. It is executed before any detailed functional or regression tests are executed. The main purpose of smoke testing is to reject a software application with defects so that QA team does not waste time testing broken

Test methodologies adopted by the Department of Environmental Protection include the snap-acceleration test, rolling-acceleration test, and power brake test for determination of exhaust smoke opacity from heavy-duty diesel vehicles (HDDVs). In a roadside environment the snap acceleration test is utilized.
